

Image data presentation

- The first step in any project involving image analysis is to visually inspect the images to see if they are actually worth analyzing.
- For example, often one wants to see whether a certain treatment caused an effect. For this it is very important to show the treated and non-treated images in the most quantitative and also in exactly the same way.
- The following practical will show you how to generate a good image data presentation.

Image data presentation

Open all files in “../image-presentation” and try to generate below images, using the indicated Fiji commands

To put the images into a PowerPoint presentation use:

[Edit > Copy to System] and then simple paste (CTRL+V) them into PowerPoint
